# CS & DA

DPP: 2

# LINEAR ALGEBRA

- **Q1** Find the rank of the matrix  $A = \begin{bmatrix} 4 & 2 & 1 & 3 \\ 6 & 3 & 4 & 7 \\ 2 & 1 & 0 & 1 \end{bmatrix}$
- Find the rank of the matrix  $A=egin{bmatrix}1&1&1\\a&a&a\\a^3&a^3&a^3\end{bmatrix}$
- Q4 Let  $M = \begin{bmatrix} 1 & 1 & 0 \\ -1 & 1 & 2 \\ 2 & 2 & 0 \\ -1 & 0 & 1 \end{bmatrix}$  .Then, the rank of M is- (A) 3 (B) 4 (C) 2 (D) 1
- **Q5** If P and Q are non- singular matrices, then for matrix M, which of the following is correct?
  - (A) Rank (PMQ) > Rank M
  - (B) Rank (PMQ) = Rank M
  - (C) Rank (PMQ) < Rank M
  - (D) Rank (PMQ) = Rank M + Rank (PQ)
- **Q6** Rank of singular matrix of order 4 can be at most
  - (A) 1

(B) 2

(C)3

- (D) 4
- **Q7** The rank of (m × n) matrix (where m< n) cannot be more than
  - (A) m

(B) n

- (C) mn (D) Non
- **Q8** If for a matrix, rank equals both the number of row and number of columns, then the matrix is called.
  - (A) Non-singular
- (B) singular
- (C) transpose
- (D) minor
- **Q9** Determine whether each of the following sets of vectors is a linearly independent subset of V.

$$V = R^2$$
, {(1, 0,), (-1, -1)}

$$V = \mathbb{R}^2$$
,  $\{(1, -1,)\}$ ,  $(1, 1)$ ,  $(2, 1)\}$ 

$$V = R^3$$
, {(1,1,0,)}, (-1, 1,1)}

$$V = R^3$$
, {(1,0,0,)}, (1, 1,0), (1, 1, 1)}

$$V = \mathbb{R}^{3}$$
, {(1,0,0,)}, (1,1,0), (1,1,1)}

**Q10** A set of r, n dimensional vector  $x_1$ ,  $x_2$ ,  $x_3$  .....  $x_r$  is said to be linearly independently, if every relation of the type

$$k_1x_1 + k_2x_2 + k_3x_3 + \dots + k_rx_r = 0$$
 implies.

- (A)  $k_1 + k_2 + k_3 + \dots + k_r = 0$
- (B)  $k_1 = k_2 = k_3 = \dots = 0$
- (C)  $k_1 + k_2 + k_3 + \dots + k_r = 0$
- (D) None
- **Q11** If A is matrix of order n × m such that A in singular then column vectors are
  - (A) LD
- (B) LI
- (C) orthogonal
- (D) orthonormal
- **Q12** If there exist no relationship between the column vectors of  $A_{m\times n}$  then
  - $(A) \rho(a) < n$
  - (B)  $\rho$ (a) = n
  - (C)  $\rho(a) < m$
  - (D)  $\rho(a) \leq n$
- **Q13** Find  $\lambda$  for which there exits a linear relationship between the vector  $\hat{i} + 2\hat{j} + 3\hat{k}$ ;

**GATE** 

$$4\hat{\mathbf{i}} + 5\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$$
,  $\lambda\hat{\mathbf{i}} + 8\hat{\mathbf{j}} + 9\hat{\mathbf{k}}$ .

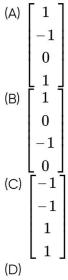

- (A)  $\lambda = 3$
- (B)  $\lambda = 7$
- (C)  $\lambda \pm 7$
- (D)  $\lambda = 0$
- **Q14** (a) Show that (2, 1, 1) and (1, -4, 2) are orthogonal.
  - (b) Determine which of the following vectors are orthogonal:

$$\mathbf{v}_1 = (-2, 6, 1), \mathbf{v}_2 = (9, 2, 6), \mathbf{v}_3 = (4, -15, -1).$$

- **Q15** Among the following, the pair of the vector orthogonal to each other is
  - (A) [3, 4, 7], [3, 4, 7]
  - (B) [O, O, O], [1, 1, O]
  - (C) [1, 0, 2], [0, 5, 0]
  - (D) [1, 1, 1], [-, -1, 1]
- **Q16** If  $\bar{a}=3\hat{i}-2\hat{j}+\hat{k}$  and  $\bar{b}=4\hat{i}+3\hat{j}-\lambda\hat{k}$  are orthogonal then  $\lambda$  = ?
  - (A) 6

- (B) 12
- (C) -6
- (D) -12
- Q17 The vector which is orthogonal is every column

vector of A = 
$$\begin{bmatrix} 1 & 1 & 0 \\ 1 & -1 & 0 \\ 1 & 0 & 1 \\ 1 & 0 & -1 \end{bmatrix}$$
 will be?

- $\begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$
- **Q18** Norm of vector  $\begin{bmatrix} 8 & 4 & 1 \end{bmatrix}^T$  is given as \_\_\_\_\_?
- Q19 The normalized vector of  $\begin{bmatrix} 2 \\ 1 \\ -4 \end{bmatrix}$  will be ?
- **Q20** For what values of  $\alpha$  and  $\beta$ , the following simultaneous equations have an infinite number of solution?

$$x + y + z = 5$$

$$x + 3y + 3z = 9$$

$$x + 2y + az = \beta$$

**Q21** The following system of equations

$$x_1 + x_2 + 2x_3 = 1$$

$$x_1 + 2x_2 + 3x_3 = 2$$

$$x_1 + 4x_2 + ax_3 = 4$$

has a unique solution. The only possible value of a is/are

- (A) O
- (B) either 0 or 1
- (C) one of 0, 1 and -1
- (D) and real number other than 5
- The solution(s) to the equations 2x + 3y = 1, x - y = 4,  $4x - y = \alpha$ , will exists if

a is equal to

- (A) -33
- (B) O
- (C)9

- (D)  $\frac{59}{5}$
- **Q23** For the following set of simultaneous equations:

$$1.5x - 0.5y = 2$$

$$4x + 2y + 3z = 9$$

$$7x + y + 5z = 10$$

- (A) The solutions is unique
- (B) Infinite many solution exists
- (C) The equations are incompatible
- (D) Finite number of multiple solution exist.
- **Q24** The conditon for consistency of simultaneous equation AX = B where C=A:B

- (A) Rank A = Rank C
- (B) Rank A ≠ Rank C
- (C) Rank A = Rank B
- (D) None of these
- **Q25** In the system of equation AX = B and A, B = C
  - (a) If the rank of A is not equal to rank of C
    - (p) consistant with unique solution
  - (b) If the rank of A is not equal to rank of C
    - (q) Infinite solutions consistant with
  - (c) If the rank A = rank of C < No. of unknowns
    (r) have a solution
  - (d) The solution of AX = 0 is always
    - (s) inconsistant
  - (A) a s, b p, c p, d r
  - (B) a > s, b > p, c > q, d > p
  - (C) a s, b p, c p, d p
  - (D) a > s, b > p, c > q, d > q
- Q26 The values of k for which equations x + y + z = 1, x + 2y + 4z = k,  $x + 4y + 10z = k^2$  have a solution
  - (A) 1 or 2
- (B) 3 or 4
- (C) 5 or 6
- (D) any values
- **Q27** For what value of b the following system of equations has hon-trivial solution?

$$2x + y + 2z = 0$$

$$x + y + 3z = 0$$

$$4x + 3y + bz = 0$$

- **Q28** Let AX = B be a system of linear equations where A is an m × n matrix and B is an n × 1 column matrix which of the following is false?
  - (A) The system has a solution, it  $\rho$ A) = r(A/B)
  - (B) If m = n and B is non-zero vector then the system has a unique solution
  - (C) If m< n and B is a zero vector then the system has infinitely many solutions
  - (D) The system will have a trivial solution when m = n, B is the zero vector and rank of A is n.
- **Q29** Let A be a square matrix of order n, then nullity of A is
  - (A) n rank A
  - (B) rank A n
  - (C) n + rank A

- (D) None of these
- Q30 An  $n \times n$  homogenous system of equations AX = 0 is given. The rank of A is r < n. Then the system has
  - (A) n r independent solutions
  - (B) r independent solutions
  - (C) no solution
  - (D) n 2r independent solutions
- Q31 The symultaneous equation

$$a_1x + b_2y + c_1 = 0$$

$$a_2x + b_2y + c_2 = 0$$

$$\left(i
ight)rac{\mathrm{a}_1}{\mathrm{a}_2}=rac{\mathrm{b}_1}{\mathrm{b}_2}=rac{\mathrm{c}_1}{\mathrm{c}_2}$$

(p)

no solution

$$\left(ii
ight)rac{\mathrm{a_1}}{\mathrm{a_2}} 
eq rac{\mathrm{b_1}}{\mathrm{b_2}} = rac{\mathrm{c_1}}{\mathrm{c_2}}$$

(q)

unique solution

$$\left(iii
ight)rac{\mathrm{a_1}}{\mathrm{a_2}}=rac{\mathrm{b_1}}{\mathrm{b_2}}
otpproxrac{\mathrm{c_1}}{\mathrm{c_2}}$$

(r) infinitely many solutions

$$(iv)\frac{\mathrm{a}_1}{\mathrm{a}_2} \not\approx \frac{\mathrm{b}_1}{\mathrm{b}_2} \not\approx \frac{\mathrm{c}_1}{\mathrm{c}_2}$$

(s) None

of these

- (A) a > r
  - b->q
  - c->p
  - d->q
- (B) a > p
  - b->s
  - c->q
  - d->r
- (C) a->s
  - b->p
  - c->r
  - d->q
- (D) None of these
- **Q32** If x + 2y 2u = 0, 2x y u = 0, x = 2z u = 0, 4x y + 3z u = 0 is a system of equations, then it is
  - (A) consistant with trivial solution
    - (B) consistant without trivial solution
    - (C) inconsistant with trivial solution
    - (D) inconsistant without trivial solution

- **Q33** The equations kx + y + z = 0, -x + ky + z = 0, -x x + y + z = 0
  - y + kz = 0 will have non-zero soluton, when real
  - k is
  - (A)3

(B) zero

(C) 1

- (D)  $\sqrt{3}$
- Q34 For the given set of equations:
  - x + y = 1
  - y + z = 1
  - x + z = 1,

Which one of the following statements is correct?

- (A) Equations are inconsistent
- (B) Equations are consistent and a single nontrivial solution exists
- (C) Equations are consistent and many solutions
- (D) Equations are consistent and only a trivial solution exists

# **Hints & Solutions**

# Q1 Text Solution:

We have,
$$A=\left[egin{array}{cccc}4&2&1&3\6&3&4&7\2&1&0&1\end{array}
ight]$$

Performing  $R_1 \rightarrow R_1 \div 4$ 

$$A = egin{bmatrix} 1 & 1/2 & 1/4 & 3/4 \ 6 & 3 & 4 & 7 \ 2 & 1 & 0 & 1 \end{bmatrix}$$

Performing 
$$R_1 \to R_1 \div 4$$
 
$$A = \begin{bmatrix} 1 & 1/2 & 1/4 & 3/4 \\ 6 & 3 & 4 & 7 \\ 2 & 1 & 0 & 1 \end{bmatrix}$$
 Performing  $R_2 \to R_2 - 6R_1$ ,  $R3 \to R_3 - 2R_1$  and  $A = \begin{bmatrix} 1 & 1/2 & 1/4 & 3/4 \\ 0 & 0 & 5/2 & 5/2 \\ 0 & 0 & -1/2 & -1/2 \end{bmatrix}$  Now, performing  $R_2 \to R_2 \times \left(\frac{2}{5}\right)$ , We g

$$A = egin{bmatrix} 1 & 1/2 & 1/4 & 3/4 \ 0 & 0 & 1 & 1 \ 0 & 0 & -1/2 & -1/2 \end{bmatrix}$$

Performing R
$$_3 o$$
 R $_3+rac{1}{2}R_2,$  we get  $A=egin{bmatrix}1&1/2&1/4&3/4\\0&0&1&1\\0&0&0&0\end{bmatrix}$ 

Hence, number of non-zero rows = 2.

So, rank of given matrix = 2

## Q2 Text Solution:

 $Reaaranging\ the\ rows\ we\ get-$ 

So the number of non - zero rows is 3

### Q3 Text Solution:

$$A = egin{bmatrix} 1 & 1 & 1 \ a & a & a \ a^3 & a^3 & a^3 \end{bmatrix}$$

multiplying R1 with a and subtracting with R2 and then multiplying R1 with  $a^3$ and subtracting with R3 we get -

$$A = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Thus the rank is 1

# Q4 Text Solution:

We need to find the rank of the matrix,

$$M = egin{bmatrix} 1 & 1 & 0 \ -1 & 1 & 2 \ 2 & 2 & 0 \ -1 & 0 & 1 \end{bmatrix}$$

Reduce the matrix to echelon form using the

" $R_2 \rightarrow R_2 + R_1$ ",  $R_3 \rightarrow R_3 - 2R_1$  and  $R_4 \rightarrow R_4 + R_1$ .

Thus we get-

$$M = egin{bmatrix} 1 & 1 & 0 \ 0 & 2 & 2 \ 0 & 0 & 0 \ 0 & 1 & 1 \end{bmatrix}$$

**GATE** 

and also applying  $R_4 \rightarrow 2R_4 - R_2$ , we have-

$$M = egin{bmatrix} 1 & 1 & 0 \ 0 & 2 & 2 \ 0 & 0 & 0 \ 0 & 0 & 0 \end{bmatrix}$$

So, rank of M = 2.

#### Q5 Text Solution:

Rank (PMQ) = Rank M, as P and Q are non singular matrices.

#### Q6 Text Solution:

So basically, the matrix is of order 4\*4. Now as it is a asingular matrix so the rank can never be 4, but if we have to explain for at most number which can be the rank, it will be 3 only.

#### Q7 Text Solution:

A is any matrix of order m×n then rank or A $\leq$ min {m, n}

rank of A < m

$$\therefore \operatorname{rank} \operatorname{of} \operatorname{A} \leq \operatorname{m} \qquad \quad \left( \because \quad m < n \right)$$

#### **Q8** Text Solution:

Given that both rows and columns are equal. So let us consider A<sub>n×n</sub>

Also given that  $\rho(A)$  = number of rows of A = number of column of A.

So,  $\rho(A) = n$  $\Rightarrow |A| \neq 0$ 

#### Q9 Text Solution:

The vectors are linearly independent if they cannot be expressed as the linear combination of each others. Thus after making linear combinations and having the system of solutions we have a trivial solution then the vectors will be independent of each other.

#### Q10 Text Solution:

The vectors are linearly independent if they cannot be expressed as the linear combination of each others.Thus after making linear combinations and having the system of solutions we have a trivial solution then the vectors will be independent of each other.

#### Q11 Text Solution:

If A is matrix of order  $n \times m$  such that A in singular then column vectors are linearly dependent.

As the matrix is singular thus the determinant will be 0, hence the columns are LD.

#### Q12 Text Solution:

If there exist no relationship between the column vectors of  $A_{m\times n}$  then they all are independent of each other thus the rank will be n.

#### Q13 Text Solution:

So we have 3 vectors as -

$$\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\widehat{\mathbf{k}},\!4\hat{\mathbf{i}} + 5\hat{\mathbf{j}} + 6\widehat{\mathbf{k}},\!\lambda\hat{\mathbf{i}} + 8\hat{\mathbf{j}} + 9\widehat{\mathbf{k}}$$

We have to express them as linear combination thus-

$$\alpha \left(\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \widehat{3j}\right) + \beta \left(4\hat{\mathbf{i}} + 5\hat{\mathbf{j}} + 6\hat{\mathbf{k}}\right)$$

$$= \lambda \hat{\mathbf{i}} + 8\hat{\mathbf{j}} + 9\hat{\mathbf{k}}$$

$$\alpha + 4\beta = \lambda - - - - \left(1\right)$$

$$2\alpha + 5\beta = 8 - - - - \left(2\right)$$

$$3\alpha + 6\beta = 9 - - - - - \left(3\right)$$
solving 3 and 4 we get -

solving 3 and 4 we get -

$$\alpha = -1, \beta = 2$$

thus putting it in eqn 1 we get

$$\lambda = -1 + 8 = 7$$

#### Q14 Text Solution:

a) The two vectors are said to be orthogonal if the dot product of two vectors are 0.

Considering the first vector and multiplying the consecutive elements we get-

orthogonal

Thus they are orthogonal.

b) Similarly moving to the next question we get-

$$v_1. v_2 = -2 * 9 + 6 * 2 + 6 * 1 = 0, thus orthogonal$$

 $v_2$ .  $v_3 = 9 * 4 - 15 * 2 - 1 * 6 = 0, thus$ 

#### Q15 Text Solution:

The two vectors  $X_1$  &  $X_2$  are said to be orthogonal if  $X_1 \cdot X_2 = 0$ 

Let  $X_1 = [102]^T$  and  $X_2 = [050]^T$ 

So, 
$$X_1$$
 .  $X_2$  
$$\begin{bmatrix} 1 \\ 0 \\ 2 \end{bmatrix} \cdot \begin{bmatrix} 0 \\ 5 \\ 0 \end{bmatrix} = 1 \times 0 + 0 \times 5 + 2 \times 0 = 0$$

## Method II:

For orthogonal vector:  $\overrightarrow{a} \cdot \overrightarrow{b} = 0$ 

$$i.\,e. \ \ \stackrel{
ightarrow}{
m a}=x_1i+y_1j+z_1k$$

$$\stackrel{
ightarrow}{\mathrm{b}} = x_2 i + y_2 j + z_2 k$$

Then:  $x_1 x_2 + y_1 y_2 + z_1 z_2 = 0$ 

Option 'c' satisfies the condtion.

#### Q16 Text Solution:

$$\bar{a}=3\hat{i}-2\hat{j}+\widehat{k},\bar{b}=4\hat{i}+3\hat{j}-\lambda\widehat{k}$$

Here as they are orthogonal thus, the dot product will be 0.

$$ar{\mathrm{a}}.\,ar{\mathrm{b}} = 12 - 6 - \lambda = 0$$
  
 $\lambda = 6$ 

# Q17 Text Solution:

$$A = \left[ egin{array}{cccc} 1 & 1 & 0 \ 1 & -1 & 0 \ 1 & 0 & 1 \ 1 & 0 & -1 \ \end{array} 
ight]$$

So we have the column vectors as  $-\left(1,1,1,1\right)^{T},\left(1,-1,0,0\right)^{T},\left(0,0,1,-1\right)^{T}$ 

Lets take the option 
$$\begin{pmatrix} c \end{pmatrix}$$

If they are orthogonl; then the dot product will turn out to be 0.

$$egin{aligned} \left( -1,-1,1,1 
ight) . & \left( 1,1,1,1 
ight) = 0 \ \ \left( -1,-1,1,1 
ight) . & \left( 1,-1,0,0 
ight) = 0 \ \ \left( -1,-1,1,1 
ight) . & \left( 0,0,1,-1 
ight) = 0 \end{aligned}$$

Lets take the option  $\left(d\right)$   $\left(0,0,0,0\right). \left(1,1,1,1\right)=0$ 

$$egin{pmatrix} (0,0,0,0) & (1,1,1,1) & (0,0,0,0) & (1,-1,0,0) & (0,0,0,0) & (0,0,1,-1) & (0,0,0,0) & (0,0,1,-1) & (0,0,0,0) & (0,0,0) & (0$$

Q18 Text Solution:

 $Norm\ is\ defined\ as\ -$ 

lets say we have a vector  $x_1\hat{i} + y_1\hat{i} + z_1\hat{i}$ then norm is  $-\sqrt{x_1^2 + y_1^2 + z_1^2}$  $Thus\ here\ -$ 

 $\sqrt{64+16+1} = \sqrt{81} = 9$ 

#### **Text Solution:** Q19

The vector given is  $\begin{bmatrix} 2 \\ 1 \\ -4 \end{bmatrix}$ 

Norm is defined as

lets say we have a vector  $x_1\hat{i} + y_1\hat{i} + z_1\hat{i}$ then norm is  $-\sqrt{{x_1}^2+{y_1}^2+{z_1}^2}$ 

 $Thus\ here\ -$ 

$$\sqrt{4+1+16} = \sqrt{21}$$

 $Thus\ the\ normalised\ vector\ will\ be-$ 

$$rac{1}{\sqrt{21}} \left[egin{array}{c} 2 \ 1 \ -4 \end{array}
ight]$$

#### **Q20** Text Solution:

Putting the system of simultaneous equations in the form

AX = B

We

 $A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 3 & 3 \\ 1 & 2 & \alpha \end{bmatrix}, \mathbf{X} = \begin{bmatrix} x \\ y \\ z \end{bmatrix}, \mathbf{B} = \begin{bmatrix} 5 \\ 9 \\ \beta \end{bmatrix}$ 

So, the augmented matrix

$$\widetilde{\mathbf{A}} = [\mathbf{A} : \mathbf{B}] = egin{bmatrix} 1 & 1 & 1 & : & 5 \\ 1 & 3 & 3 & : & 9 \\ 1 & 2 & lpha & : & eta \end{bmatrix}$$

Operating  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ ,

We get 
$$\begin{bmatrix} 1 & 1 & 1 & : & 5 \\ 0 & 2 & 2 & : & 4 \\ 0 & 1 & \alpha - 1 & : & \beta - 5 \end{bmatrix}$$

Operating  $R_2 \rightarrow R_2$ we get

$$\sim \begin{bmatrix} 1 & 1 & 1 & : & 5 \\ 0 & 1 & 1 & : & 2 \\ 0 & 1 & \alpha - 1 & : & \beta - 5 \end{bmatrix}$$

Operating  $R_3 \rightarrow R_3 - R_2$ , we get

$$\begin{bmatrix}
1 & 1 & 1 & : & 5 \\
0 & 1 & 1 & : & 2 \\
0 & 1 & \alpha - 2 & : & \beta - 7
\end{bmatrix}$$

Now, for ininfinte solution the last row must be zero.

Therefore,  $\alpha$  – 2 = 0 implies  $\alpha$  = 2  $\beta$  – 7 = 0 implies  $\beta$  = 7

#### Q21 Text Solution:

Putting the given linear equations in AX = B form

$$A = egin{bmatrix} 1 & 1 & 2 \ 1 & 2 & 3 \ 1 & 4 & lpha \end{bmatrix}, X = egin{bmatrix} x_1 \ x_2 \ x_3 \end{bmatrix} ext{and } ext{B} = egin{bmatrix} 1 \ 2 \ 4 \end{bmatrix}$$

Now, augmented matrix

$$[A:B] = egin{bmatrix} 1 & 1 & 2 & : & 1 \ 1 & 2 & 3 & : & 2 \ 1 & 4 & lpha & : & 4 \end{bmatrix}$$

$$=egin{bmatrix} 1 & 1 & 2 & : & 1 \ 0 & 1 & 1 & : & 1 \ 0 & 3 & a-2 & : & 3 \end{bmatrix}$$

Operating  $R_3 \rightarrow R_3 - 3R_2$ , we get

$$= egin{bmatrix} 1 & 1 & 2 & : & 1 \ 0 & 1 & 1 & : & 1 \ 0 & 0 & a-5 & : & 0 \end{bmatrix}$$

If  $a - 5 \neq 0 \Rightarrow a \neq 5$ 

Then, rank of [A] = rank of [A:B] =3

Hence, a can take any value expect 5

#### Q22 Text Solution:

$$2x + 3y = 1....(i)$$

$$x - y = 4$$
....(ii)

$$4x - y = \alpha$$
.....(iii)

Form equation (i) and equation (ii)

$$x=rac{13}{5},y=rac{-7}{5}$$

The solution of equations exists

$$\Rightarrow \alpha = 4\left(\frac{13}{5}\right) - \left(-\frac{7}{5}\right)$$

$$\alpha = \frac{59}{5}$$

#### Q23 Text Solution:

$$\begin{vmatrix} A \\ = Determinant \ of \\ \begin{bmatrix} 1.5 & -0.5 & 0 \\ 4 & 2 & 3 \\ 7 & 1 & 5 \end{bmatrix} \\ = (1.5) (10-3) + (0.5) (20-21)$$

$$= 10.5 - 0.5 = 10 \neq 0$$

# Q24 Text Solution:

We have to find the conditon for consistency of simultaneous equation AX = B where C=A:B That C is equal to A augmented B, no in order for the consistency of equations means that the solutions must exist either unique or infinite thus for this the rank of A must be equal to rank of C.

#### Q25 Text Solution:

- (a) If the rank A rank of C
- (r) have a solution
- (c) If the rank A = rank of C < No. of unknowns
  - (p) consistant with unique solution
- (c) If the rank A = rank of C < No. of unknowns
  - (g) Infinite solutions consistant with
- (d) The solution of AX = 0 is always
  - (r) have a solution

The correct solutions is a->s,b->p,c->a,d->r

#### Q26 Text Solution:

The values of k for which equations x + y + z = 1, x + 2y + 4z = k,  $x + 4y + 10z = k^2$  have a solution

$$\begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 2 & 4 & k \\ 1 & 4 & 10 & k^2 \end{bmatrix}$$

$$R_2 - > R_2 - R_1$$

$$R_3 - > R_3 - R_1$$

$$\begin{bmatrix} 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & k-1 \\ 0 & 3 & 9 & k^2-1 \end{bmatrix}$$

$$R_3 - > R_3 - 3R_2$$

$$egin{bmatrix} 1 & 1 & 1 & 1 \ 0 & 1 & 3 \ 0 & 0 & 0 \ \end{bmatrix} egin{bmatrix} & 1 & & 1 \ & k-1 \ & k^2-1-3K+3 \ \end{bmatrix}$$

$$K^2 - 3K + 2 = 0$$

$$K-2=0, K-1=0$$

$$K = 1, 2$$

#### Q27 Text Solution:

Sience the system of homogeneous equations has non-trivial solution

Hence, 
$$|A| = 0$$

$$\begin{vmatrix} 2 & 1 & 2 \\ 1 & 1 & 3 \\ 4 & 3 & b \end{vmatrix} = 0$$

$$\Rightarrow 2 \begin{vmatrix} 1 & 3 \\ 3 & b \end{vmatrix} - 1 \begin{vmatrix} 1 & 3 \\ 4 & b \end{vmatrix} + 2 \begin{vmatrix} 1 & 1 \\ 4 & 3 \end{vmatrix} = 0$$

$$\Rightarrow 2(b - 9) - 1(b - 12) + 2(3 - 4) = 0$$

$$\Rightarrow b - 8 = 0$$

$$\Rightarrow b = 8$$

#### Q28 Text Solution:

Given, that  $A_{m*n} X_{n*1} = B_{m*1}$ 

According to option (b)

We can take m = n & B = 0

So (1) = 
$$A_{m*n} X_{n*1} = O_{m*1}$$

If |A| is not equal to 0, system have unique solution if |A|=0 system have infininte solution.

Hence, option (b) in wrong because condition of unique solution is not mentioned.

### Q29 Text Solution:

Let A be a square matrix of order n, then nullity of A is

then the nullity is defined as n-r,

The nullity of a matrix is the dimension of the null space of A, also called the kernel of A.

### Q30 Text Solution:

An  $n \times n$  homogenous system of equations AX = 0 is given. The rank of A is r < n. Then the system has will have n-r independent solutions

#### **Text Solution:** Q31

a) 
$$\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$$

(r) Infinity many

b) 
$$\frac{a_1}{a_2} \neq \frac{b_1}{b_2} = \frac{c_1}{c_2}$$

(a) unique

c) 
$$\frac{a_1}{a_2} = \frac{b_1}{b_2} \not\approx \frac{c_1}{c_2}$$
  
d)  $\frac{a_1}{a_2} \not\approx \frac{b_1}{b_2} \not\approx \frac{c_1}{c_2}$ 

(p) No solution

d) 
$$\frac{a_1}{a_2} \not\approx \frac{b_1}{b_2} \not\approx \frac{c_1}{c_2}$$

(s) None of

these

The correct solutions will be-

a->r

b->a

c->p

d->a

#### Q32 Text Solution:

$$If \ x + 2y - 2u = 0, \ 2x - y - u = 0, \ x + 2z - u = 0, \ 4x - y + 3z - u = 0$$
 $Thus \ AX = O$ 

$$\begin{bmatrix} 1 & 2 & -2 & 0 \\ 2 & 1 & 1 & 0 \end{bmatrix} \begin{bmatrix} x \\ 1 & 1 & 1 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 & -2 & 0 \\ 2 & -1 & -1 & 0 \\ 1 & 0 & -1 & 2 \\ 4 & -1 & -1 & 3 \end{bmatrix} \begin{bmatrix} x \\ y \\ u \\ z \end{bmatrix} = O$$

If u will calculate the determinant of A its coming out to be non-zero, thus consistant with trivial solution.

### Q33 Text Solution:

The equations are 
$$kx + y + z = 0, -x + ky + z = 0, -x - y + kz = 0$$

$$\begin{bmatrix} k & 1 & 1 \\ -1 & k & 1 \\ -1 & -1 & k \end{bmatrix} \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Thus the determinant should be equal to 0

$$\begin{bmatrix} k & 1 & 1 \\ -1 & k & 1 \\ -1 & -1 & k \end{bmatrix} = A$$
$$|A| = 0$$

$$k \binom{k^2+1}{k^2+1} - 1 \binom{-k+1}{k+1} + 1 \binom{1+k}{k}$$

$$= 0$$

$$k^3+k+k-1+1+k=0$$

$$k^{3} + k + k - 1 + 1 + k = 0$$
  
 $k^{3} + 3k = 0$   
 $k = 0$ 

## Q34 Text Solution:

Lets make the augmented matrix for the  $system\ of\ equations\ -$ 

$$\begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$
$$\begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

As the determinant of A is not 0 and thus the rank of A = 3 thus the system of equations will have a unique solution.
